Feedback - Group E - Which College to Go

TA: Nico Rojas

04/01/2021

General Comments.

- The general topic looks interesting.

- However, I'm concerned about three aspects of the proposal.

    - First, it seems as if you will do four different versions of the same map. If you look into the syllabus you'll note that you need to have static images based on ggplot. Also, you are encouraged to do text analysis and one network visualization. You could discuss this last requirement with the professor, and eventually, you may skip it. In any case, the project still needs more elements.

    - Second, you do not mention what is your data-set. It seems as if you are using the replication data from the Chetty et al 2017 paper. You need to urgently open the data and check whether you have what you need for your map and for doing some other visualizations.

    - Third, the main question is interesting, however, it is not clear to me how will you show which colleges offer the best chance to climb up the ladder. It may be necessary to provide more details about the relationship between the question and your maps.

- Overall, this project proposal is still too preliminary. I encourage you to make sure this is feasible, provide a better explanation of how you are going to answer your research question, and draw the lines of a project that include all that is required.

Specific Comments

- The Tigris package may have some useful US polygons in case you need them.

- On the TA section from week 07, you may find an implementation of a leaflet search plugin that could be useful.
